**Quinazoline derivatives as inhibitors of HIV reverse transcriptase.**

Compounds having a quinazolin-2-(thi)one nucleus are described. These compounds are useful in the inhibition of HIV reverse transcriptase, the prevention or treatment of infection by HIV and the treatment of AIDS, either as compounds, pharmaceutically acceptable salts, pharmaceutical composition ingredients, whether or not in combination with other antivirals, immunomodulators, antibiotics or vaccines. Methods of treating AIDS and methods of preventing or treating infection by HIV are also described.

**EP 0 530 994 A1**

# BACKGROUND OF THE INVENTION

A retrovirus designated human immunodeficiency virus (HIV) is the etiological agent of the complex disease that includes progressive destruction of the immune system (acquired immune deficiency syndrome; AIDS) and degeneration of the central and peripheral nervous system. This virus was previously known as LAV, HTLV-III, or ARV. A common feature of retrovirus replication is reverse transcription of the RNA genome by a virally encoded reverse transcriptase to generate DNA copies of HIV sequences, a required step in viral replication. It is known that some compounds are reverse transcriptase inhibitors and are effective agents in the treatment of AIDS and similar diseases, e.g., azidothymidine or AZT.

Nucleotide sequencing of HIV shows the presence of a pol gene in one open reading frame [Ratner, L. *et al.*, *Nature*, **313**, 277(1985)]. Amino acid sequence homology provides evidence that the pol sequence encodes reverse transcriptase, an endonuclease and an HIV protease [Toh, H. *et al.*, *EMBO J.* **4**, 1267 (1985); Power, M.D. *et al.*, *Science*, **231**, 1567 (1986); pearl, L.H. *et al.*, *Nature* **329**, 351(1987)].

Applicants demonstrate that the compounds of this invention are inhibitors of HIV reverse transcriptase.

# BRIEF DESCRIPTION OF THE INVENTION

Compounds of formula I or II, as herein defined, are disclosed. These compounds are useful in the inhibition of HIV reverse transcriptase, the prevention of infection by HIV, the treatment of infection by HIV and in the treatment of AIDS and/or ARC, either as compounds, pharmaceutically acceptable salts (when appropriate), pharmaceutical composition ingredients, whether or not in combination with other antivirals, anti-infectives, immunomodulators, antibiotics or vaccines. Methods of treating AIDS, methods of preventing infection by HIV, and methods of treating infection by HIV are also disclosed.

The compounds of the present invention may have asymmetric centers and occur as racemates, racemic mixtures and as individual diastereomers, or enantiomers, with all isomeric forms being included in the present invention.

When any variable (e.g., G, R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup>, etc.) occurs more than one time in any constituent or in formula I, its definition on each occurrence is independent of its definition at every other occurrence. Also, combinations of substituents and/or variables are permissible only if such combinations result in stable compounds.

As used herein except where not defined, "alkyl" is intended to include both branched and straight-chain saturated aliphatic hydrocarbon groups having the specified number of carbon atoms; "alkenyl" is intended to cover

both branched- and straight chain alkyl groups with at least one carbon-carbon double bond; "alkynyl" is intended to cover both branched- and straight chain alkyl groups with at least one carbon-carbon triple bond. "Halogen" or "halo" as used herein, means fluoro, chloro, bromo and iodo.

As used herein, with exceptions as noted, "aryl" is intended to mean phenyl, naphthyl, tetrahydronaphthyl, biphenyl, phenanthryl, anthryl or acenaphthyl.

The term heterocycle or heterocyclic, as used herein except where noted, represents a stable 5- to 7-membered monocyclic or stable 8- to 11-membered bicyclic ring which is either saturated or unsaturated, and which consists of carbon atoms and from one to four heteroatoms selected from the group consisting of N, O and S, and wherein the nitrogen and sulfur heteroatoms may optionally be oxidized, and including any bicyclic group in which any of the above-defined heterocyclic rings is fused to a benzene ring. The heterocyclic ring may be attached at any heteroatom or carbon atom which results in the creation of a stable structure. Examples of such heterocyclic elements include piperidinyl, piperazinyl, 2-oxopiperazinyl, 2-oxopiperidinyl, 2-oxopyrrolidinyl, 2-oxoazepinyl, azepinyl, pyrrolyl, 4-piperidonyl, pyrrolidinyl, pyrazolyl, pyrazolidinyl, imidazolyl, imidazolidinyl, pyridyl, pyrazinyl, pyrimidinyl, pyridazinyl, oxazolyl, oxazolidinyl, isoxazolyl, isoxazolidinyl, morpholinyl, thiazolyl, thiazolidinyl, isothiazolyl, quinuclidinyl, isothiazolidinyl, indolyl, quinolinyl, isoquinolinyl, benzimidazolyl, thiadiazoyl, benzopyranyl, benzothiazolyl, benzoxazolyl, furyl, tetrahydrofuryl, benzofuranyl, tetrahydropyranyl, thienyl, benzothieryl, thiamorpholinyl, thiamorpholinyl sulfoxide, thiamorpholinyl sulfone, and oxadiazolyl.

The compounds of the present invention can be synthesized by the following schemes.

SCHEME I

$\underline{1}$   $\xrightarrow[\text{Dabco, } \triangle]{\text{R}^3\text{NCX/CH}_3\text{CN}}$   $\xrightarrow[\text{removal of H}_2\text{O}]{\text{xylylene/ } \triangle}$   $\underline{2}$

$\underline{3}$   $\xrightarrow[\text{solvent}]{\text{R}^2-\text{M}}$   $\underline{4}$

The chemical structures are as follows:

$\underline{3}$ : A quinazolinone derivative with two phenyl rings, each substituted with a group  $(G)_n$ . The quinazolinone core has a nitrogen atom substituted with  $\text{R}^3$  and a carbonyl group  $\text{C}=\text{X}$ .

$\underline{4}$ : A tricyclic derivative where the quinazolinone core from  $\underline{3}$  has been reacted with  $\text{R}^2-\text{M}$ . The resulting structure features a central carbon atom bonded to two phenyl rings (each with  $(G)_n$  substituents) and a nitrogen atom substituted with  $\text{R}^3$ . The quinazolinone core is now a dihydroquinazolinone, with a hydrogen atom added to the nitrogen and the carbonyl group  $\text{C}=\text{X}$  remains.

According to Sternbach, L. et al. J. Org. Chem. **31**, 1007 (1966), the hydroxy intermediate **2** is prepared by heating **1** in the presence of absolute ethanol with an excess of e.g. alkylisothiocyanate, followed by hydrolysis with aqueous acid to give **2**. Subsequent dehydration of **2** by refluxing in xylenes affords the tetraene **3**, wherein aromaticity of the benzene ring is lost. Nucleophilic addition at the 4-position to form a second carbon-carbon bond can be accomplished in a variety of ways. In Scheme I, reaction with the appropriate Grignard reagent gives **4**. Alternatively, **1** (X=O) may be directly converted to **3** by reaction with excess alkylisothiocyanate, acetonitrile, and triethylenediamine in the presence of heat.

The compounds of the present inventions are useful in the inhibition of HIV reverse transcriptase, (including resistant varieties thereof) the prevention of treatment of infection by human immunodeficiency virus (HIV) and the treatment of consequent pathological conditions such as AIDS. Treating AIDS or preventing or treating infection by HIV is defined as including, but not limited to, treating a wide range of states of HIV infection: AIDS, ARC (AIDS related complex), both symptomatic and asymptomatic, and actual or potential exposure to HIV. For example, the compounds of this invention are useful in treating infection by HIV after suspected past exposure to HIV by e.g., blood transfusion, exchange of body fluids, bites, accidental needle stick, or exposure to patient blood during surgery.

For these purposes, the compounds of the present invention may be administered orally, parenterally (including subcutaneous injections, intravenous, intramuscular, intrasternal injection or infusion techniques), by inhalation spray, or rectally, in dosage unit formulations containing conventional non-toxic pharmaceutically-acceptable carriers, adjuvants and vehicles.

Thus, in accordance with the present invention there is further provided a method of treating and a pharmaceutical composition for treating HIV infection and AIDS. The treatment involves administering to a patient in need of such treatment a pharmaceutical composition comprising a pharmaceutical carrier and a therapeutically-effective amount of a compound of the present invention.

These pharmaceutical compositions may be in the form of orally-administrable suspensions or tablets; nasal sprays; sterile injectable preparations, for example, as sterile injectable aqueous or oleagenous suspensions or suppositories.

When administered orally as a suspension, these compositions are prepared according to techniques well-known in the art of pharmaceutical formulation and may contain microcrystalline cellulose for imparting bulk, alginic acid or sodium alginate as a suspending agent, methylcellulose as a viscosity enhancer, and sweeteners/flavoring agents known in the art. As immediate release tablets, these compositions may contain microcrystalline cellulose, dicalcium phosphate, starch, magnesium stearate and lactose and/or other excipients, binders, extenders, disintegrants, diluents and lubricants known in the art.

When administered by nasal aerosol or inhalation, these compositions are prepared according to techniques well-known in the art of pharmaceutical formulation and may be prepared as solutions in saline, employing benzyl alcohol or other suitable preservatives, absorption promoters to enhance bioavailability, fluorocarbons, and/or other solubilizing or dispersing agents known in the art.

The injectable solutions or suspensions may be formulated according to known art, using suitable non-toxic, parenterally-acceptable diluents or solvents, such as mannitol, 1,3-butanediol, water, Ringer's solution or isotonic sodium chloride solution, or suitable dispersing or wetting and suspending agents, such as sterile, bland, fixed oils, including synthetic mono- or diglycerides, and fatty acids, including oleic acid.

When rectally administered in the form of suppositories, these compositions may be prepared by mixing the drug with a suitable non-irritating excipient, such as cocoa butter, synthetic glyceride esters or polyethylene glycols, which are solid at ordinary temperatures, but liquidify and/or dissolve in the rectal cavity to release the drug.

The compounds of this invention can be administered orally to humans in a dosage range of 1 to 100 mg/kg body weight in divided doses. One preferred dosage range is 1 to 10 mg/kg body weight orally in divided doses. Another preferred dosage range is 1 to 20 mg/kg body weight orally in divided doses. It will be understood, however, that the specific dose level and frequency of dosage for any particular patient may be varied and will depend upon a variety of factors including the activity of the specific compound employed, the metabolic stability and length of action of that compound, the age, body weight, general health, sex, diet, mode and time of administration, rate of excretion, drug combination, the severity of the particular condition, and the host undergoing therapy.

The present invention is also directed to combinations of the HIV reverse transcriptase inhibitor compounds with one or more agents useful in the treatment of AIDS. For example, the compounds of this invention may be effectively administered, whether at periods of pre-exposure and/or post-exposure, in combination with effective amounts of the AIDS antivirals, immunomodulators, antiinfectives, or vaccines, such as those in the following table.

## EXAMPLE 1

R-Metal Addition to Tetraene5 A. 6-Chloro-3,4-dihydro-3,4-dimethyl-4-phenyl-2(1H)-quinazolinthione

A 200 mL 3-neck round bottomed flask fitted with a stirring bar and argon inlet was charged with 6-chloro-3-methyl-4-phenyl-2(3H)-quinazolinthione (1.00 g, 3.49 mmol, see Sternbach et al., J. Org. Chem. **31**, 1007 (1966)) and 70 mL of dry ether. Methylmagnesium bromide (2.91 M in ether, 3.6 mL) was added to this solution  
 10 over 1-2 min. at 25°C. After 1 h the mixture was poured into 400 mL of ice-cold saturated aqueous NH<sub>4</sub>Cl solution and extracted with CH<sub>2</sub>Cl<sub>2</sub>. The combined organic layers were washed with saturated aqueous NaHCO<sub>3</sub> solution, brine, and dried (MgSO<sub>4</sub>). Removal of the drying agent and solvent left a foam which, upon trituration with ether/hexane, deposited 849 mg of the title compound as a crystalline white solid, mp 167-168°C. An analytical sample was recrystallized from EtOAc/hexane:

15 <sup>1</sup>H-NMR (CDCl<sub>3</sub>): δ 1.94 (s, 3H), 3.09 (s, 3H), 6.46 (d, J=2Hz, 1H), 6.68 (d, J=8.5Hz, 1H), 7.07 (dd, J=2, 8.5Hz, 1H), 7.30-7.48 (m, 5H), 8.58 (s, 1H).

B. 6-Chloro-3,4-dihydro-3-methyl-4-phenyl-4-vinyl-2(1H)-quinazolinthione

20 In the manner outlined in part A of this Example, a THF solution of vinylmagnesium bromide (threefold excess) was added to a THF solution of 6-chloro-3-methyl-4-phenyl-2(3H)-quinazolinthione to give the title compound, mp 185-185.5°C (CH<sub>3</sub>CN).

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): δ 3.16 (s, 3H), 5.02 (d, J=17Hz, 1H), 5.50 (d, J=10.5Hz, 1H), 6.22 (dd, J=10.5, 17Hz, 1H), 6.49 (d, J=2Hz 1H), 6.77 (br d, J=8.5Hz, 1H), 7.15 (dd, J=8.5, 2Hz, 1H), 7.30-7.50 (m, 5H), 8.60-9.00 (br s, 1H).  
 25

C. 6-Chloro-3,4-dihydro-3-methyl-4-ethyl-4-phenyl-2(1H)-quinazolinthione

To a 10 mL oven dried round botomed flask with a stirring bar and an argon inlet was added sodium hydride-oil suspension (12 mg, of a 60% suspension, 0.30 mmol). The oil was removed with two hexane washings and the oil free sodium hydride was suspended in dry DMF (0.5 mL). To this suspension was added the product from step A (0.07g, 0.182 mmol). This mixture was stirred until hydrogen evolution had ceased and methyl iodide (0.023 mL, 0.366 mmol) was added with a syringe. This mixture was stirred for 18h at room temperature. The mixture was diluted with EtOAc and this solution was washed with water, 10% aqueous citric acid and brine. Drying (MgSO<sub>4</sub>), filtration and removal of the solvent in vacuo gave 71 mg of the methylation product which was used in step C without further purification.

Drying (MgSO<sub>4</sub>), filtration, and removal of the solvent *in vacuo* gave 450mg of crude product. This material was chromatographed on 80g of silica gel using 4:1 EtOAc-hexane as eluant. There was obtained 362 mg of pure 6-chloro-3,4-dihydro-4-(3-(4-toluenesulfonyloxy)propyl)-4-phenyl-2(1H)-quinazolinone as a colorless foam.

Step G: (+/-) 9-chloro-10b-phenyl-1,2,3,10b-tetrahydropyrrolo[1,2-c]quinazolin-5(6H)-one

To a 25 mL round bottomed flask with a stirring bar, and an argon inlet was added 6-chloro-3, 4-dihydro-4-(3-(4-toluenesulfonyloxy)propyl)-4-phenyl-2(1H)-quinazolinone (100 mg, 0.212 mmol), finely powdered potassium carbonate (250 mg, 1.809 mmol), and dry DMF. This well stirred mixture was heated at 100°C for 2h. The cooled reaction mixture was diluted with EtOAc (100 mL) and this solution was washed with water (3X 30 mL), and brine (50 mL). Drying (MgSO<sub>4</sub>), filtration, removal of the solvent *in vacuo*, and recrystallization from EtOAc-hexanes gave 50 mg of (+/-) 9-chloro-10b-phenyl-1,2,3,10b-tetrahydropyrrolo[1,2-c]quinazolin-5(6H)-one as white crystals. mp: 231-233°C.

<sup>1</sup>H NMR (CDCl<sub>3</sub>): δ 1.60-1.83 (m, 1 H), 1.97-2.10 (m, 1 H), 2.45 (m, 1 H), 2.79 (dd, J=5.8, 10.8 Hz, 1 H), 3.75 (m, 2 H), 6.67 (d, J=8.5 Hz, 1 H), 7.20-7.40 (m, 7 H), 7.77 (br s, 1 H).

EXAMPLE 1036-Chloro-3,4-dicyclopropyl-3,4-dihydroquinazolin-2(1H)-one5 Step A: N-[(2-(Cyclopropylcarbonyl)-4-chlorophenyl)-N'-cyclopropylurea

A mixture containing 800 mg (2.76 mmol) of N-[(2-cyclopropylcarbonyl)-4-chlorophenyl]-N'-(1-imidazolyl)urea and 0.57 mL (8.3 mmol) of cyclopropylamine in 5 mL each of acetonitrile and THF was stirred at 40°C for 4 hours. The mixture was then concentrated under vacuum and the solid which remained was triturated in

10 1-2 mL of acetonitrile to afford the title compound as a white solid, mp 142.5-143°C;

<sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 0.67 (m, 2H); 0.97 (m, 2H); 1.12-1.18 (m, 2H); 1.27 (m, 2H); 2.66 (m, 2H); 4.99 (s, 1H); 7.50 (dd, J = 2.5, 9 Hz, 1H); 8.06 (d, J = 2.5 Hz, 1H); 8.64 (d, J = 9 Hz, 1H).

Step B: 6-chloro-3,4-dicyclopropyl-3,4-dihydroquinazolin-2(1H)-one

15 140 mg (0.50 mmol) of N-[(2-(Cyclopropylcarbonyl)-4-chlorophenyl)-N'-cyclopropylurea] was dissolved in 0.5 mL glacial HOAc and the stirred yellow solution treated with 62 mg (1.0 mmol) of powdered sodium cyanoborohydride in portions during 10 min. at room temperature. The mixture was stirred one hour, diluted with ice water, and filtered to give 108 mg of the title compound. Recrystallization from n-butyl chloride hexane gave

20 a white solid mp 197-198°C.

<sup>1</sup>H NMR (CDCl<sub>3</sub>): δ 0.305 (m, 1H; CH<sub>A</sub>H), 0.450 (m, 2H; CH<sub>2</sub>), 0.625 (m, 1H; CH<sub>2</sub>), 0.750 (m, 2H; CH<sub>2</sub>), 0.822 (m, 1H; CH<sub>2</sub>), 1.12 (m, 1H; CH<sub>2</sub>), 1.26 (m, 1H; CH), 2.93 (m, 1H; CH N), 3.641 (1H, d, J = 8.79 Hz; H<sub>4</sub>), 6.688 (1H, d, J = 8.36; H<sub>5</sub>), 7.01 (1H, d, J = 2.2 Hz; H<sub>5</sub>), 7.162 (1H, dd, J = 8.38 Hz, 2.34 Hz; H<sub>7</sub>), 7.28 (1H, S(b), NH).

25 REVERSE TRANSCRIPTASE ASSAY

The assay measures the incorporation of tritiated deoxyguanosine monophosphate by recombinant HIV reverse transcriptase (HIV RT<sub>R</sub>) (or other RT) into acid-precipitable cDNA at the Km values of dGTP and poly r(C)-oligo d(G)<sub>12-18</sub>. The inhibitors of the present invention inhibit this incorporation.

30 Thirty μL of a reaction mixture containing equal volumes of: 500 mM Tris-HCl (pH 8.2), 300 mM MgCl<sub>2</sub>, 1200 mM KCl, 10 mM DTT, 400 μg/mL poly r(c)-oligo d(G) [prepared by dissolving 1.5 mg (25 U) poly r(C)-oligo d(G) in 1.5 ml sterile distilled H<sub>2</sub>O and diluting to 400 μg/ml], 0.1 μCi/μl [<sup>3</sup>H] dGTP, 160 μM dGTP, was added to 10 μl sterile distilled H<sub>2</sub>O, 2.5 μl of potential inhibitor and 10 μL of 5 nM purified HIV RT<sub>R</sub> in tubes. The mixture was incubated at 37°C for 45 minutes.

35 After incubation is complete, the tubes were cooled in ice for 5 minutes. Ice-cold 13% TCA containing 10 mM NaPP<sub>i</sub> (200 μl) is added and the mixture incubated on ice for 30 minutes. The precipitated cDNA is removed by filtration using presoaked glass filters [TCA, NaPP<sub>i</sub>]. The precipitate is then washed with 1N HCl, 10 mM NaPP<sub>i</sub>.

The filter discs are then counted in a scintillation counter.

40 Under these conditions [dGTP] and poly r(C)-oligo d(G)<sub>12-18</sub> each are approximately equal to the appropriate Km value. Approximately 5-6,000 cpm of [<sup>3</sup>H] GMP are incorporated into acid-precipitable material. The RT reaction is concentration- and time-dependent. DMSO (up to 5%) does not affect enzyme activity. Calculated IC<sub>50</sub> values for the tested compounds of this invention vary from about 12 nM to more than 300 μM, with the most preferred compounds having values of between about 30 nM and about 60 μM. The (+) optical isomer

45 of compound 4 has a IC<sub>50</sub> value of about 0.06 nM.

CELL SPREAD ASSAY

Inhibition of the spread of HIV in cell culture was measured according to Nunberg, J. H. et al., J. Virol. 65, 4887 (1991). In this assay, MT-4 T-lymphoid cells were infected with HIV-1 by using a predetermined inoculum, and cultures were incubated for 24h. At this time, ≤1% of the cells were positive by indirect immunofluorescence. Cells were then extensively washed and distributed into 96-well culture dishes. Serial twofold dilutions of inhibitor were added to the wells, and cultures were continued for 3 additional days. At 4 days postinfection, 100% of the cells in control cultures were infected. HIV-1 p24 accumulation was directly correlated with virus spread. The cell culture inhibitory concentration was defined as the inhibitor concentration which reduced the spread of infection by at least 95%, or CIC<sub>95</sub>. Because all virus populations appeared monodisperse and displayed parallel dose-response curves, resistance was quantified as the ratio of inhibitor concentrations that

reduced the spread of infection by at least 95%.

While the foregoing specification teaches the principles of the present invention, with examples provided for the purpose of illustration, it will be understood that the practice of the invention encompasses all of the usual variations, adaptations, and modifications, as come within the scope of the following claims and its equivalents.
